

Tweak

Make your Desktop really dance: This is the ultimate wallpaper Tweak — moving, dancing, singing images on your Desktop. You can place any AVI video clip on your desktop where it will play continuously.

But first you'll need a file ending in the .avi extension, which indicates Microsoft's proprietary video format, and you'll need Microsoft's *FrontPage* (or another application for creating Web pages in HTML).

Even if you have not created any AVI files or received some from friends, you may have several on your system without knowing it. Many games install them to play short segments of video. Other programs sometimes use them to present logos and other information on splash screens.

If a search of your hard disk turns up no files ending in .avi, you can always download some for free from shareware sites on the Internet. That's where we got the famous dancing infant in the example at right. A large, high-resolution file is best.

Once you've located a video file you want to use, open *FrontPage* to a new FrontPage Editor window. Look for the command on the menus to insert Video or Active Elements.

Insert your selected AVI file and right-click on the image. Select Image Properties or Picture Properties from the pop-up menu and, in the window that appears, select the Appearance tab. Put a check beside Specify Size and fill in the figures to make the image fill your screen (800 by 600 pixels for most 15-inch monitors).

If you want the video to play continually, click on

```
%SystemRoot%\explorer.exe /n, /e, /select, C:\
```

Click OK and the next time you open Explorer you should be shown your entire system.

Add and Remove more

Through all the upgrades of Windows since 1995 one thing has remained constant: The Add/Remove Programs control panel (also called Add or Remove Programs) does not include all the applications, utilities and applets you might want to delete.
